Action maps are a nice way in Interchange to turn human readable links into Interchange searches.

The required syntax for triggering a search is far from nice:

```
$CGI->{co} = 1;
$CGI->{fi} = 'products';
$CGI->{st} = 'db';
$CGI->{sf} = join "\0", 'prod_group', 'category';
$CGI->{op} = join "\0", 'eq', 'eq';
$CGI->{se} = join "\0", $prod_group, $category;
$CGI->{sp} = 'results';
$CGI->{mv_todo} = 'search';
$Tag->update('process');
return (1, 'results');
```

I agreed with pj on IRC that a [search] usertag would make things more easier to the enduser.
