

# Flaws in Interchange's Error Model

Stefan Hornburg (Racke)

2008-09-06

Error messages targetted to the user are kept in the session and are manipulated with the `[error]` tag. Warnings are manipulated with the `[warnings]` tag.

This model has the following flaws:

- By default, the errors are retained in the session. This utterly confuses the user.
- `[error all=1]` displays errors in a all but random order. Errors should be displayed in the same order as they appear in the corresponding form.
- Different semantics of `[error]` and `[warnings]`.
