

OpenLDAP: TLS init def ctx failed: -207

Stefan Hornburg (Racke)

2009-12-03

Today I upgraded OpenLDAP in order to fix the insufficient input validation security problem (DSA-1943-1).

Unfortunately OpenLDAP refused to start after the upgrade.

After adding

```
loglevel config stats
```

to the configuration file it gave me at least the meaningful error message:

```
TLS init def ctx failed: -207.
```

The research in the mailinglist led to the solution. It turned out that the openldap user had insufficient permissions for reading the TLS private key.
