

SaneSecurity Unofficial Phishing and Scam Signatures for ClamAV

Stefan Hornburg (Racke)

2008-03-16

SaneSecurity offers unofficial phishing and scam signatures for ClamAV. The usage page lists a variety of download scripts. I opted for the "download script 1". This script requires the ClamAV command line interface and Curl for operation. The `clamav` and `curl` packages fulfil these requirements on Debian.

```
/usr/local/sbin# wget -O update_sanesecurity [[http://www.sanesecurity.com/clamav/update_sanesecurity
```

```
/usr/local/sbin# chmod +x update_sanesecurity
```

I would also recommend to change the `stderr_loglevel` from `none` to `error`, so cron will notify you about errors by email.

```
# Log messages with this or greater severity to standard error
```

```
stderr_loglevel=error
```
